

HUMAIN PARTNERSHIP · ANNOUNCED AT LEAP 2026, RIYADH

A sovereign enterprise OS for intelligence.

HUMAIN OS is the enterprise-grade, AI-native operating system KORA is developing in collaboration with HUMAIN, the PIF-backed AI company in Saudi Arabia. The partnership was announced at LEAP 2026 in Riyadh, where HUMAIN OS was demonstrated for the first time in an early form.

HUMAIN OS is built on KORA's Linux and agentic platform. It is organized around intent, intelligence and action: users express what they want to accomplish, and the operating system assembles the relevant context, selects the appropriate local or cloud intelligence, and coordinates agents and applications to complete the work. It integrates enterprise email, calendars and chat to provide a unified view of workplace information, alongside a suite of AI-native office applications.

HUMAIN OS is expected to become commercially available in 2027, debuting on the world's first OEM PCs to combine a Linux-based desktop operating system with the Snapdragon X2 Elite platform. HUMAIN has said it is targeting a 26-billion-parameter model running locally on the Qualcomm NPU.

HUMAIN OS and KORA are two operating systems on one foundation: the Linux desktop, Cortex, neural workspaces and file systems that KORA built with Qualcomm Technologies on Snapdragon. HUMAIN OS serves the enterprise. KORA, The Operating System for Intelligence, serves developers and creators, and comes to Snapdragon-powered PCs in 2027.
